 PyTorch

1. Why PyTorch

A zoo of frameworks!

Caffe
(UC Berkeley)

Caffe2
(Facebook)
mostly features absorbed by PyTorch

Torch
(NYU / Facebook)

PyTorch
(Facebook)

Theano
(U Montreal)

TensorFlow
(Google)

PaddlePaddle
(Baidu)

Chainer
(Preferred Networks)

The company has officially migrated its research infrastructure to PyTorch

MXNet
(Amazon)

Developed by U Washington, CMU, MIT, Hong Kong U, etc but main framework of choice at AWS

CNTK
(Microsoft)

JAX
(Google)

And others...

Source: CS231N by Fei-Fei Li, Ranjay Krishna, Danfei Xu

1. Why PyTorch (Cont'd)

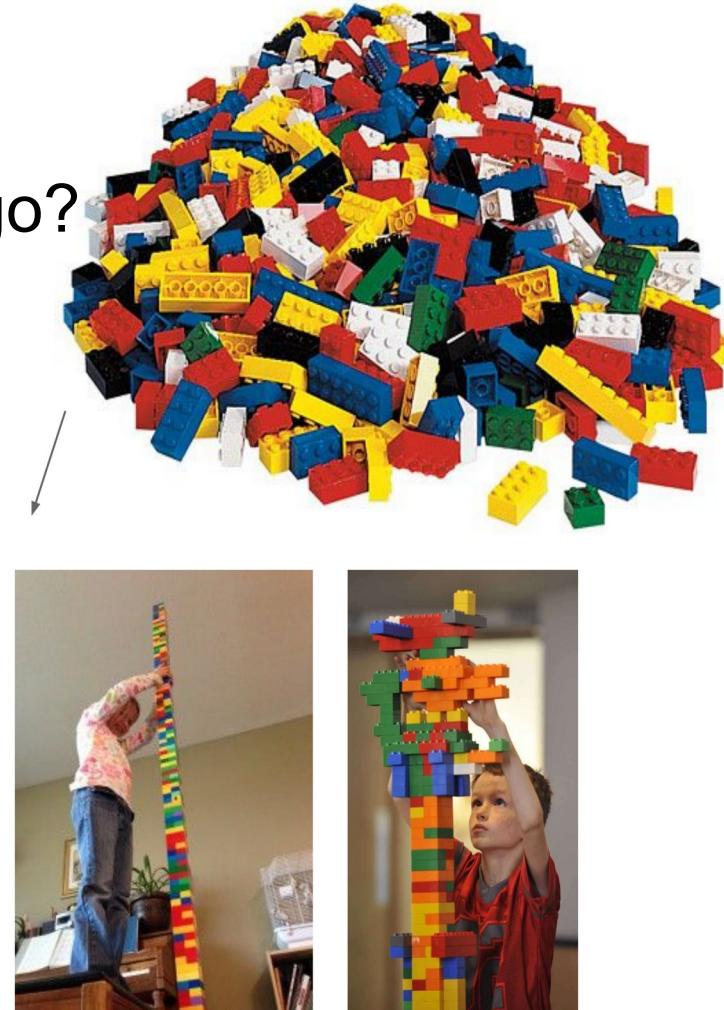

Wanna build deep neural networks just like playing Lego?

PyTorch is all you need!

(1) Pythonic

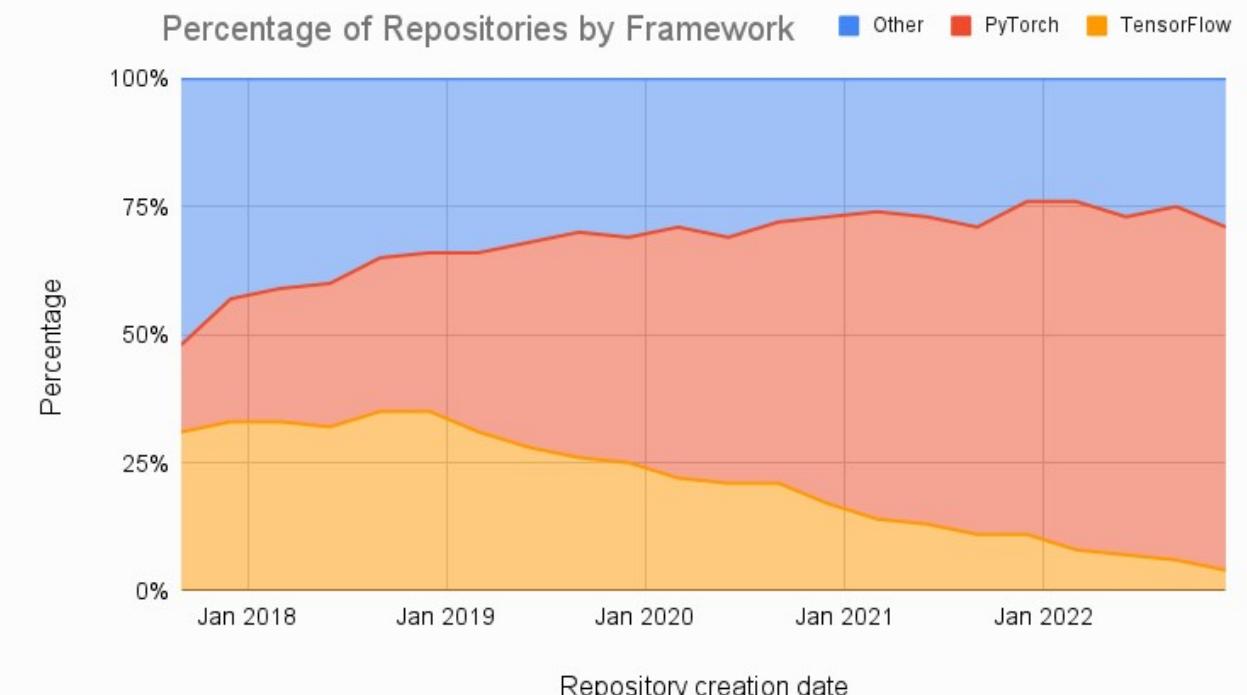

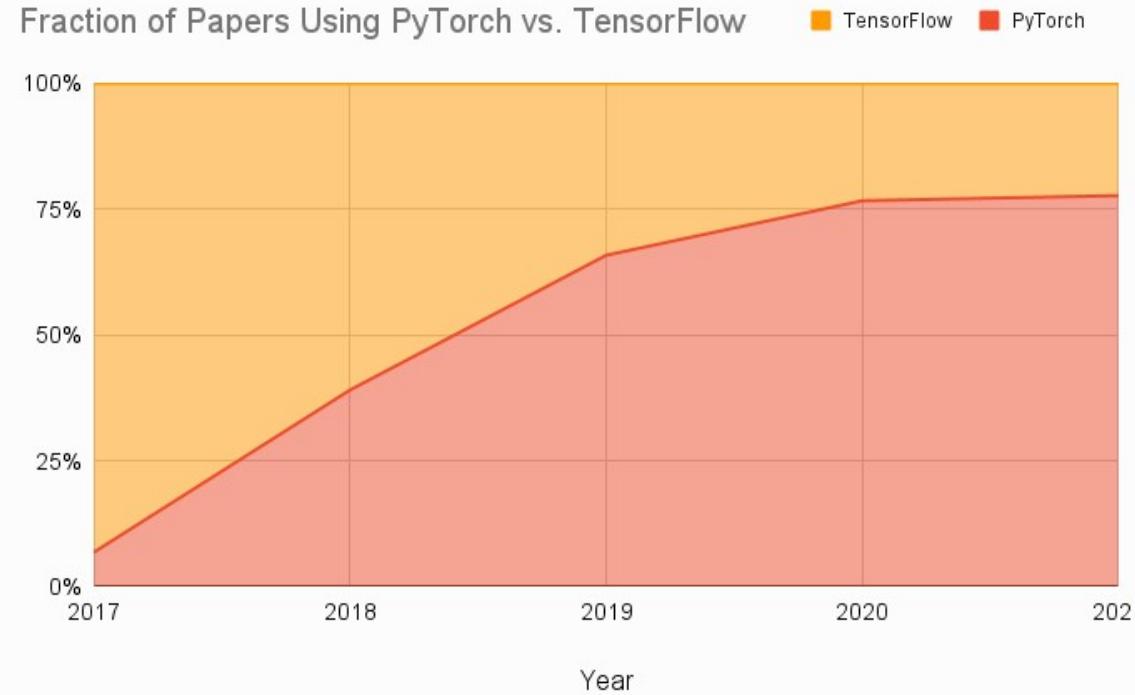

(2) Dynamic Graphs

(3) Ecosystems

Source: CS231N by Fei-Fei Li & Andrej Karpathy & Justin Johnson

Tensors

2 Tensors

1D Tensor

7	4	9
---	---	---

array([7, 4, 9])

Numpy 1D array

2D Tensor

3	0	9
9	1	2
5	4	2

array([3, 0, 9], [9, 1, 2], [5, 4, 2])

Numpy 2D array

3D Tensor

1	0	1
7	55	2

6	32	3
19	33	6

5	8	5
---	---	---

11	21	2
4	43	6
12	1	7

array([[[11, 21, 2], [4, 43, 6], [12, 1, 7]],
 [[6, 32, 3], [19, 33, 6], [5, 8, 5]],
 [[1, 0, 1], [7, 55, 2], [8, 4, 59]]])

Numpy 3D array

2.1 Initializing a Tensor

Directly from data

Tensors can be created directly from data. The data type is automatically inferred.

```
data = [[1, 2],[3, 4]]  
x_data = torch.tensor(data)
```

From a NumPy array

Tensors can be created from NumPy arrays (and vice versa - see [Bridge with NumPy](#)).

```
np_array = np.array(data)  
x_np = torch.from_numpy(np_array)
```

2.1 Initializing a Tensor (Cont'd)

From another tensor:

The new tensor retains the properties (shape, datatype) of the argument tensor, unless explicitly overridden.

```
x_ones = torch.ones_like(x_data) # retains the properties of x_data
print(f"Ones Tensor: \n {x_ones} \n")

x_rand = torch.rand_like(x_data, dtype=torch.float) # overrides the datatype of
x_data
print(f"Random Tensor: \n {x_rand} \n")
```

Out:

```
Ones Tensor:
tensor([[1, 1],
       [1, 1]])
```

```
Random Tensor:
tensor([[0.5788, 0.2201],
       [0.2905, 0.9572]])
```

2.2 Attributes of a Tensor

Tensor attributes describe their shape, datatype, and the device on which they are stored.

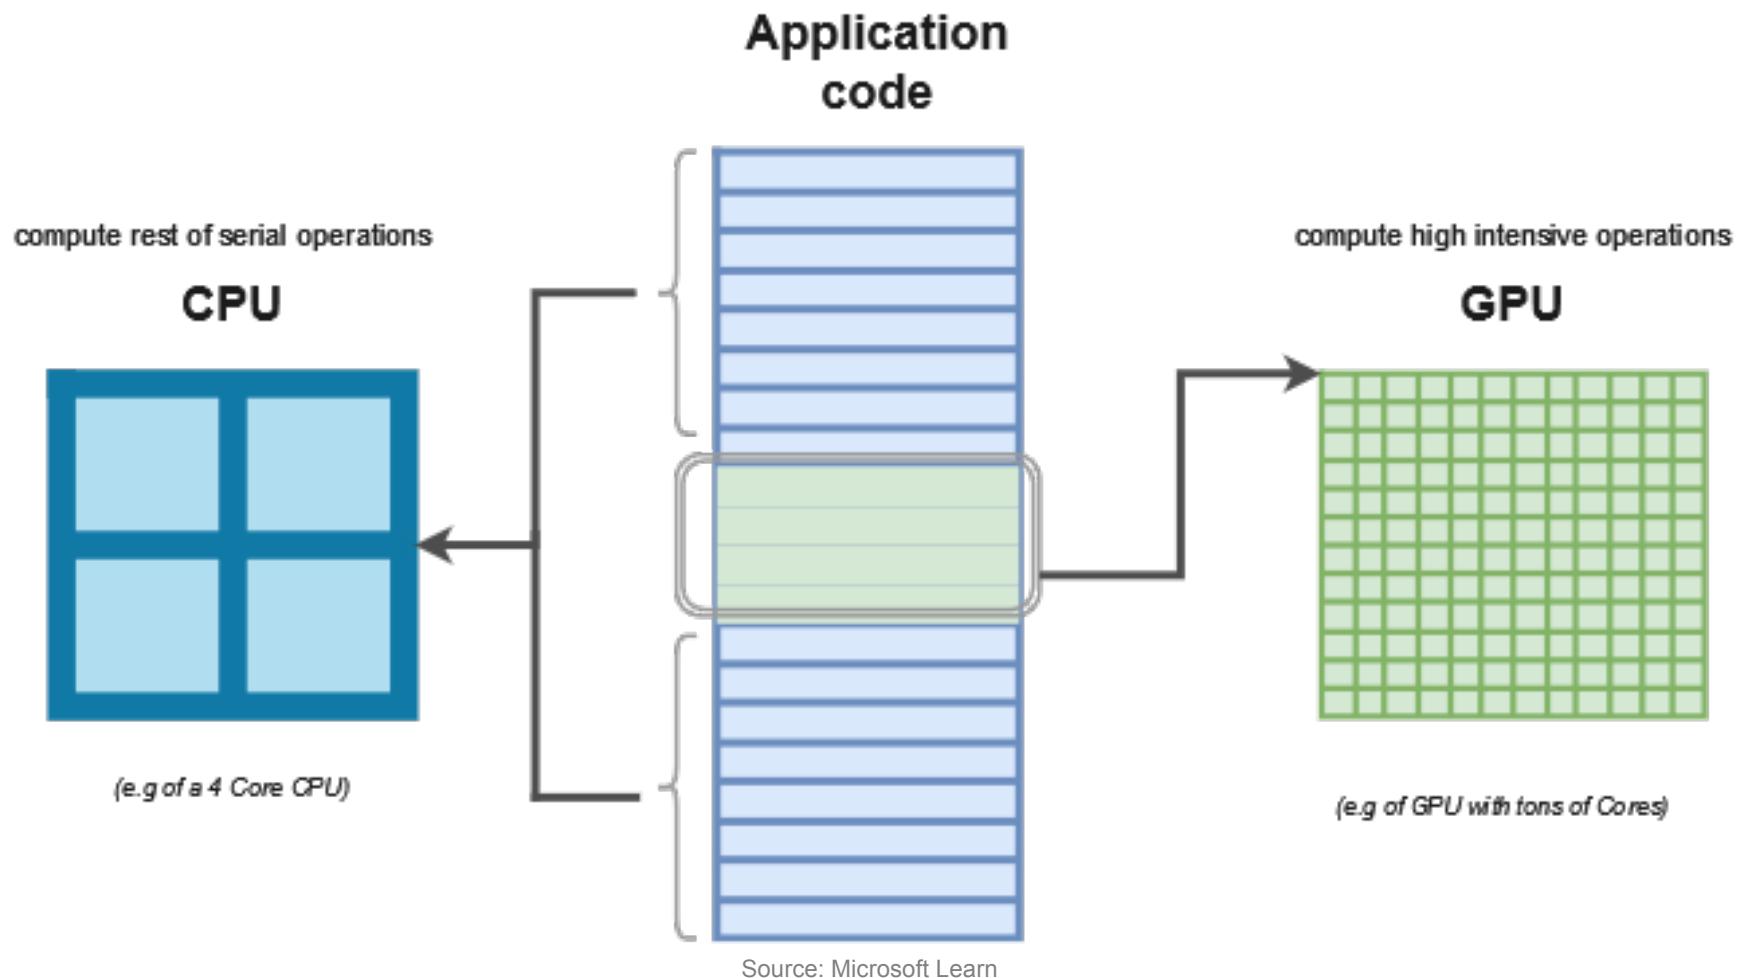

```
tensor = torch.rand(3,4)

print(f"Shape of tensor: {tensor.shape}")
print(f"Datatype of tensor: {tensor.dtype}")
print(f"Device tensor is stored on: {tensor.device}")
```

Out:

```
Shape of tensor: torch.Size([3, 4])
Datatype of tensor: torch.float32
Device tensor is stored on: cpu
```

2.3 Operation on Tensors

2.3 Operation on Tensors (Cont'd)

By default, tensors are created on the CPU. We need to explicitly move tensors to the GPU using `.to` method (after checking for GPU availability). Keep in mind that copying large tensors across devices can be expensive in terms of time and memory!

```
# We move our tensor to the GPU if available
if torch.cuda.is_available():
    tensor = tensor.to("cuda")
```

2.3 Operation on Tensors (Cont'd)

Standard numpy-like indexing and slicing:

```
tensor = torch.ones(4, 4)
print(f"First row: {tensor[0]}")
print(f"First column: {tensor[:, 0]}")
print(f"Last column: {tensor[..., -1]}")
tensor[:,1] = 0
print(tensor)
```

Out:

```
First row: tensor([1., 1., 1., 1.])
First column: tensor([1., 1., 1., 1.])
Last column: tensor([1., 1., 1., 1.])
tensor([[1., 0., 1., 1.],
        [1., 0., 1., 1.],
        [1., 0., 1., 1.],
        [1., 0., 1., 1.]])
```

2.3 Operation on Tensors (Cont'd)

Joining tensors You can use `torch.cat` to concatenate a sequence of tensors along a given dimension. See also `torch.stack`, another tensor joining op that is subtly different from `torch.cat`.

```
t1 = torch.cat([tensor, tensor, tensor], dim=1)
print(t1)
```

Out:

```
tensor([[1., 0., 1., 1., 0., 1., 1., 1., 0., 1., 1.],
       [1., 0., 1., 1., 0., 1., 1., 1., 0., 1., 1.],
       [1., 0., 1., 1., 0., 1., 1., 1., 0., 1., 1.],
       [1., 0., 1., 1., 0., 1., 1., 1., 0., 1., 1.]])
```

2.3 Operation on Tensors (Cont'd)

Arithmetic operations

```
# This computes the matrix multiplication between two tensors. y1, y2, y3 will
# have the same value
# ``tensor.T`` returns the transpose of a tensor
y1 = tensor @ tensor.T
y2 = tensor.matmul(tensor.T)

y3 = torch.rand_like(y1)
torch.matmul(tensor, tensor.T, out=y3)

# This computes the element-wise product. z1, z2, z3 will have the same value
z1 = tensor * tensor
z2 = tensor.mul(tensor)

z3 = torch.rand_like(tensor)
torch.mul(tensor, tensor, out=z3)
```

2.3 Operation on Tensors (Cont'd)

Single-element tensors If you have a one-element tensor, for example by aggregating all values of a tensor into one value, you can convert it to a Python numerical value using `item()`:

```
agg = tensor.sum()  
agg_item = agg.item()  
print(agg_item, type(agg_item))
```

Out:

```
12.0 <class 'float'>
```

2.3 Operation on Tensors (Cont'd)

In-place operations Operations that store the result into the operand are called in-place. They are denoted by a `_` suffix. For example: `x.copy_(y)`, `x.t_()`, will change `x`.

```
print(f"tensor{`\n`}")  
tensor.add_(5)  
print(tensor)
```

Out:

```
tensor([[1., 0., 1., 1.],  
       [1., 0., 1., 1.],  
       [1., 0., 1., 1.],  
       [1., 0., 1., 1.]])
```

```
tensor([[6., 5., 6., 6.],  
       [6., 5., 6., 6.],  
       [6., 5., 6., 6.],  
       [6., 5., 6., 6.]])
```

2.3 Operation on Tensors (Cont'd)

Over 100 tensor operations, including:

arithmetic,

linear algebra,

matrix manipulation (transposing, indexing, slicing),

sampling

and more are comprehensively described here:

<https://pytorch.org/docs/stable/torch.html>

Datasets & DataLoaders

Fashion-MNIST

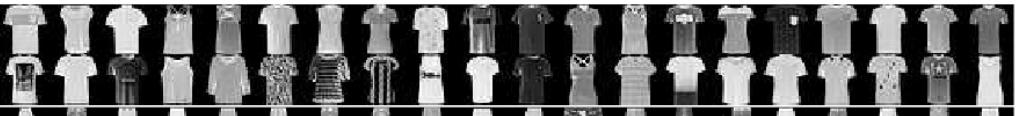

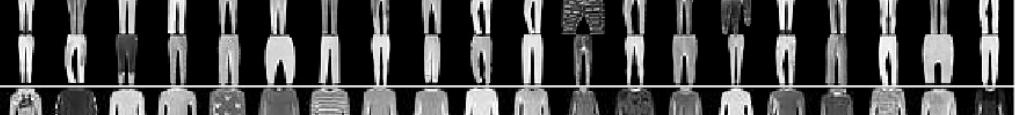

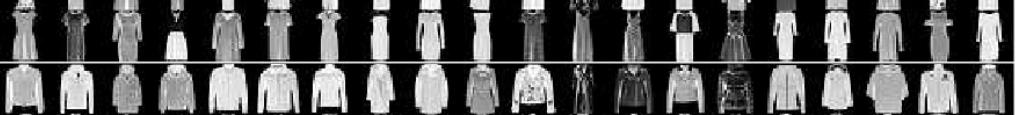

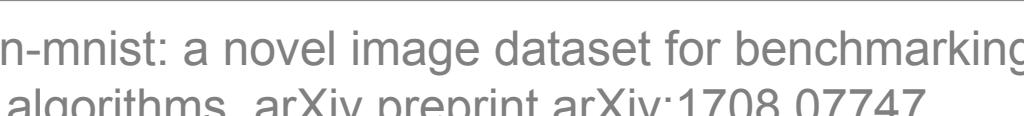

28 × 28 grayscale images

70, 000 fashion products

10 categories

7, 000 images per category

The training set has 60, 000 images
and the test set has 10, 000 images.

Label	Description	Examples
0	T-Shirt/Top	
1	Trouser	
2	Pullover	
3	Dress	
4	Coat	
5	Sandals	
6	Shirt	
7	Sneaker	
8	Bag	
9	Ankle boots	

Xiao et al. Fashion-mnist: a novel image dataset for benchmarking machine learning algorithms. arXiv preprint arXiv:1708.07747.

3.1 Loading a Dataset

```
import os
import pandas as pd
from torchvision.io import read_image

class CustomImageDataset(Dataset):
    def __init__(self, annotations_file, img_dir, transform=None,
target_transform=None):
        self.img_labels = pd.read_csv(annotations_file)
        self.img_dir = img_dir
        self.transform = transform
        self.target_transform = target_transform

    def __len__(self):
        return len(self.img_labels)

    def __getitem__(self, idx):
        img_path = os.path.join(self.img_dir, self.img_labels.iloc[idx, 0])
        image = read_image(img_path)
        label = self.img_labels.iloc[idx, 1]
        if self.transform:
            image = self.transform(image)
        if self.target_transform:
            label = self.target_transform(label)
        return image, label
```

3.2 Iterating and Visualizing the Dataset

We can index `Datasets` manually like a list: `training_data[index]`. We use `matplotlib` to visualize some samples in our training data.

```
labels_map = {
    0: "T-Shirt",
    1: "Trouser",
    2: "Pullover",
    3: "Dress",
    4: "Coat",
    5: "Sandal",
    6: "Shirt",
    7: "Sneaker",
    8: "Bag",
    9: "Ankle Boot",
}
figure = plt.figure(figsize=(8, 8))
cols, rows = 3, 3
for i in range(1, cols * rows + 1):
    sample_idx = torch.randint(len(training_data), size=(1,)).item()
    img, label = training_data[sample_idx]
    figure.add_subplot(rows, cols, i)
    plt.title(labels_map[label])
    plt.axis("off")
    plt.imshow(img.squeeze(), cmap="gray")
plt.show()
```

3.2 Iterating and Visualizing the Dataset (Cont'd)

3.3 Creating a Custom Dataset for your files

```
import os
import pandas as pd
from torchvision.io import read_image

class CustomImageDataset(Dataset):
    def __init__(self, annotations_file, img_dir, transform=None,
target_transform=None):
        self.img_labels = pd.read_csv(annotations_file)
        self.img_dir = img_dir
        self.transform = transform
        self.target_transform = target_transform

    def __len__(self):
        return len(self.img_labels)

    def __getitem__(self, idx):
        img_path = os.path.join(self.img_dir, self.img_labels.iloc[idx, 0])
        image = read_image(img_path)
        label = self.img_labels.iloc[idx, 1]
        if self.transform:
            image = self.transform(image)
        if self.target_transform:
            label = self.target_transform(label)
        return image, label
```

3.3 Creating a Custom Dataset for your files (Cont'd)

```
import os
import pandas as pd
from torchvision.io import read_image

class CustomImageDataset(Dataset):
    def __init__(self, annotations_file, img_dir, transform=None, target_transform=None):
        self.img_labels = pd.read_csv(annotations_file)
        self.img_dir = img_dir
        self.transform = transform
        self.target_transform = target_transform

    def __len__(self):
        return len(self.img_labels)

    def __getitem__(self, idx):
        img_path = os.path.join(self.img_dir, self.img_labels.iloc[idx, 0])
        image = read_image(img_path)
        label = self.img_labels.iloc[idx, 1]
        if self.transform:
            image = self.transform(image)
        if self.target_transform:
            label = self.target_transform(label)
        return image, label
```

3.4 Preparing your data for training with DataLoaders

The `Dataset` retrieves our dataset's features and labels one sample at a time. While training a model, we typically want to pass samples in “minibatches”, reshuffle the data at every epoch to reduce model overfitting, and use Python’s `multiprocessing` to speed up data retrieval.

`DataLoader` is an iterable that abstracts this complexity for us in an easy API.

```
from torch.utils.data import DataLoader

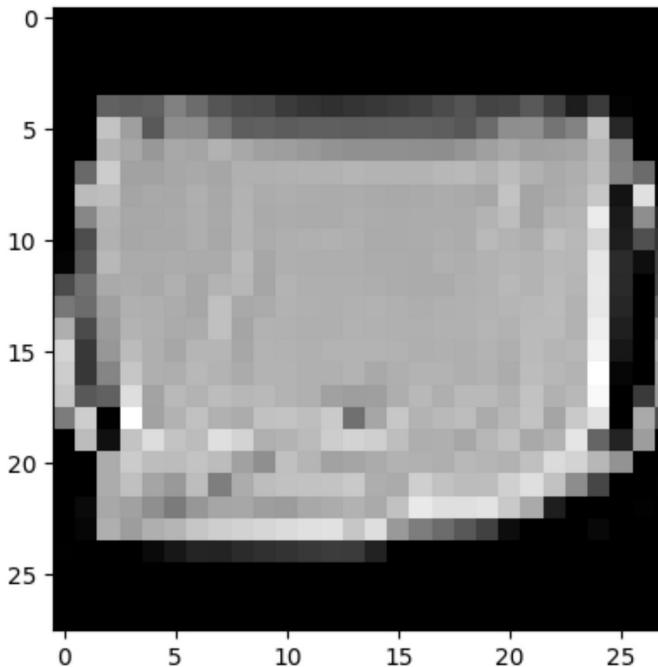

train_dataloader = DataLoader(training_data, batch_size=64, shuffle=True)
test_dataloader = DataLoader(test_data, batch_size=64, shuffle=True)
```

3.5 Iterate through the DataLoader

We have loaded that dataset into the `DataLoader` and can iterate through the dataset as needed. Each iteration below returns a batch of `train_features` and `train_labels` (containing `batch_size=64` features and labels respectively). Because we specified `shuffle=True`, after we iterate over all batches the data is shuffled (for finer-grained control over the data loading order, take a look at [Samplers](#)).

```
# Display image and label.
train_features, train_labels = next(iter(train_dataloader))
print(f"Feature batch shape: {train_features.size()}")
print(f"Labels batch shape: {train_labels.size()}")
img = train_features[0].squeeze()
label = train_labels[0]
plt.imshow(img, cmap="gray")
plt.show()
print(f"Label: {label}")
```

3.5 Iterate through the DataLoader (Cont'd)

Out:

```
Feature batch shape: torch.Size([64, 1, 28, 28])
Labels batch shape: torch.Size([64])
Label: 8
```

Transforms

4 Transforms

The FashionMNIST features are in PIL Image format, and the labels are integers. For training, we need the features as normalized tensors, and the labels as one-hot encoded tensors. To make these transformations, we use `ToTensor` and `Lambda`.

```
import torch
from torchvision import datasets
from torchvision.transforms import ToTensor, Lambda

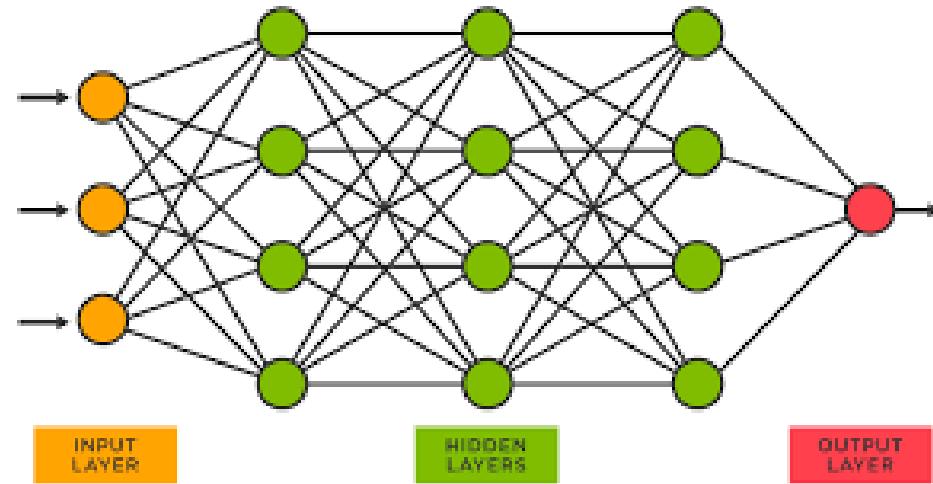

ds = datasets.FashionMNIST(
    root="data",
    train=True,
    download=True,
    transform=ToTensor(),
    target_transform=Lambda(lambda y: torch.zeros(10, dtype=torch.float).scatter_(0,
torch.tensor(y), value=1))
)
```

Build Model

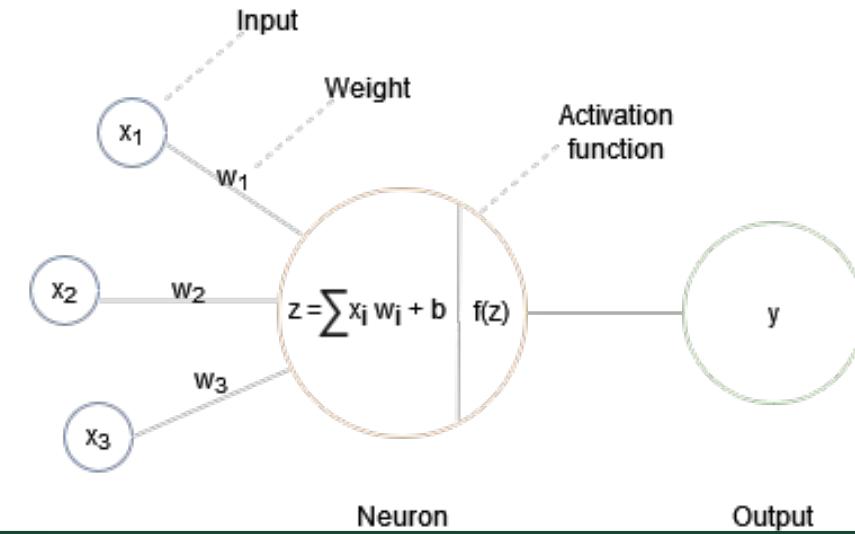

5.1 torch.nn.Module

(The base class for all neural network modules)

```
import os
import torch
from torch import nn
from torch.utils.data import DataLoader
from torchvision import datasets, transforms
```

Source: Microsoft Learn

5.2 Get Device for Training

We want to be able to train our model on a hardware accelerator like the GPU, if it is available. Let's check to see if `torch.cuda` is available, else we continue to use the CPU.

```
device = "cuda" if torch.cuda.is_available() else "cpu"  
print(f"Using {device} device")
```

Out:

```
Using cuda device
```

5.3 Define the Class

We define our neural network by subclassing `nn.Module`, and initialize the neural network layers in `__init__`. Every `nn.Module` subclass implements the operations on input data in the `forward` method.

```
class NeuralNetwork(nn.Module):
    def __init__(self):
        super(NeuralNetwork, self).__init__()
        self.flatten = nn.Flatten()
        self.linear_relu_stack = nn.Sequential(
            nn.Linear(28*28, 512),
            nn.ReLU(),
            nn.Linear(512, 512),
            nn.ReLU(),
            nn.Linear(512, 10),
        )

    def forward(self, x):
        x = self.flatten(x)
        logits = self.linear_relu_stack(x)
        return logits
```

5.3 Define the Class (Cont'd)

We create an instance of `NeuralNetwork`, and move it to the `device`, and print its structure.

```
model = NeuralNetwork().to(device)
print(model)
```

Out:

```
NeuralNetwork(
    (flatten): Flatten(start_dim=1, end_dim=-1)
    (linear_relu_stack): Sequential(
        (0): Linear(in_features=784, out_features=512, bias=True)
        (1): ReLU()
        (2): Linear(in_features=512, out_features=512, bias=True)
        (3): ReLU()
        (4): Linear(in_features=512, out_features=10, bias=True)
    )
)
```

5.3 Define the Class (Cont'd)

To use the model, we pass it the input data. This executes the model's `forward`, along with some **background operations**. Do not call `model.forward()` directly!

Calling the model on the input returns a 2-dimensional tensor with dim=0 corresponding to each output of 10 raw predicted values for each class, and dim=1 corresponding to the individual values of each output. We get the prediction probabilities by passing it through an instance of the `nn.Softmax` module.

```
X = torch.rand(1, 28, 28, device=device)
logits = model(X)
pred_probab = nn.Softmax(dim=1)(logits)
y_pred = pred_probab.argmax(1)
print(f"Predicted class: {y_pred}")
```

Out:

Predicted class: tensor([2], device='cuda:0')

Autograd

6 Autograd

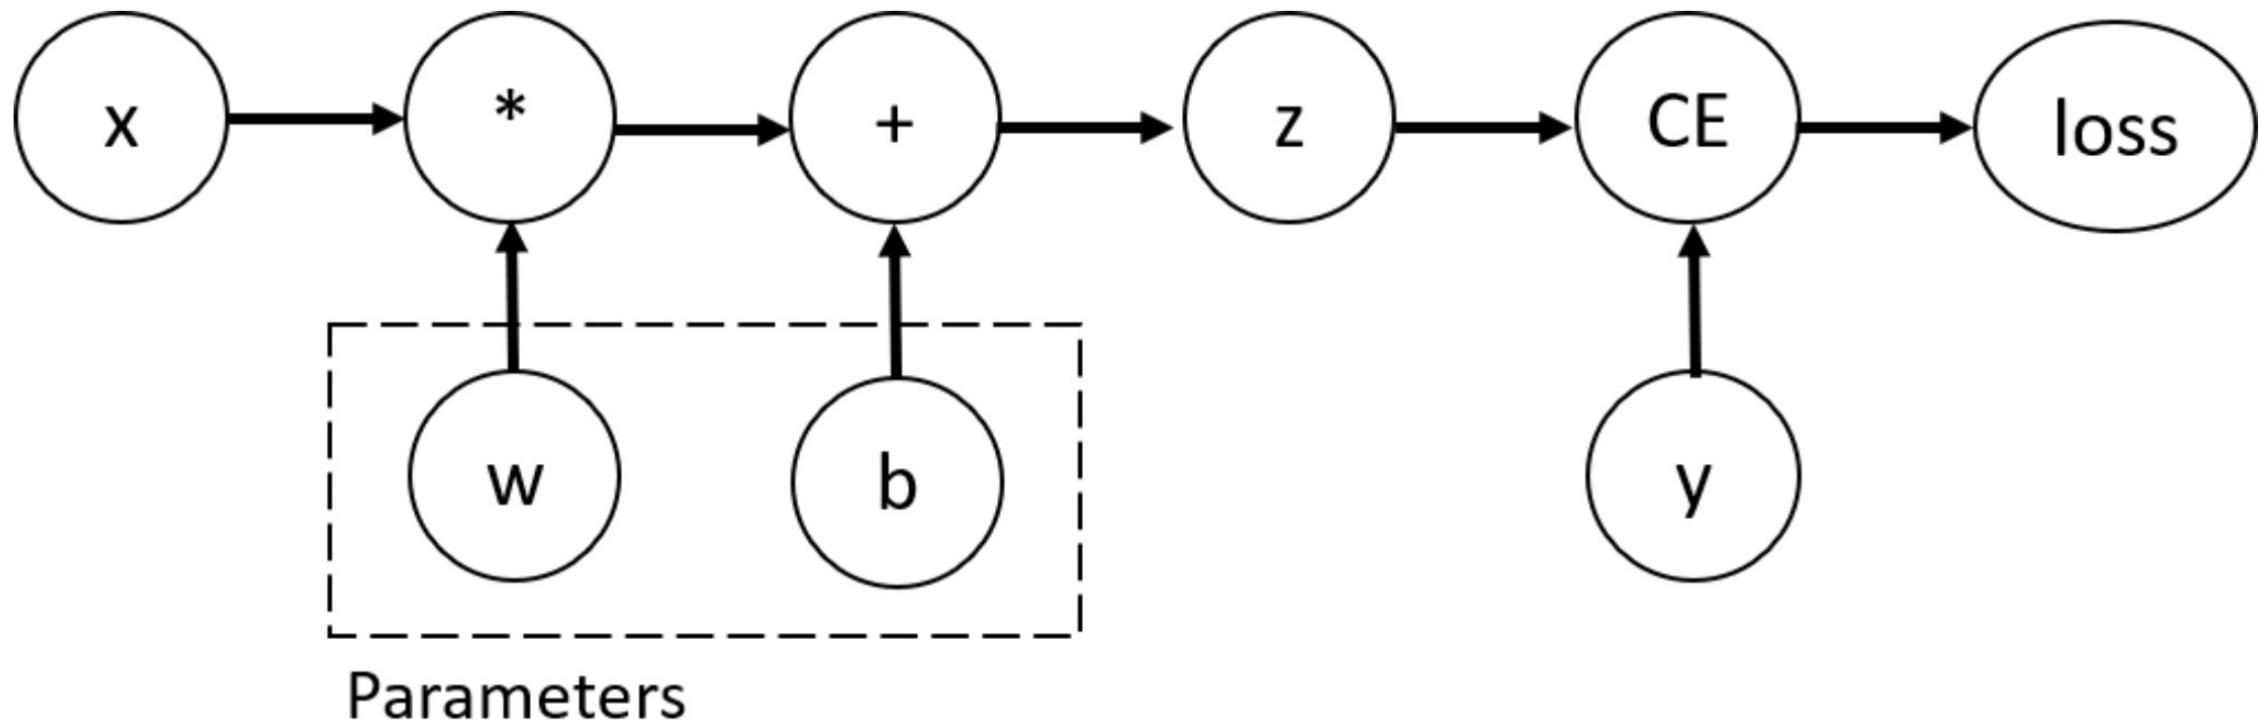

Consider the simplest one-layer neural network, with input `x`, parameters `w` and `b`, and some loss function. It can be defined in PyTorch in the following manner:

```
import torch

x = torch.ones(5)  # input tensor
y = torch.zeros(3)  # expected output
w = torch.randn(5, 3, requires_grad=True)
b = torch.randn(3, requires_grad=True)
z = torch.matmul(x, w)+b
loss = torch.nn.functional.binary_cross_entropy_with_logits(z, y)
```

6.1 Tensors, Functions and Computational graph

This code defines the following **computational graph**:

In this network, `w` and `b` are **parameters**, which we need to optimize. Thus, we need to be able to compute the gradients of loss function with respect to those variables. In order to do that, we set the `requires_grad` property of those tensors.

6.2 Computing Gradients

To optimize weights of parameters in the neural network, we need to compute the derivatives of our loss function with respect to parameters, namely, we need $\frac{\partial \text{loss}}{\partial w}$ and $\frac{\partial \text{loss}}{\partial b}$ under some fixed values of `x` and `y`. To compute those derivatives, we call `loss.backward()`, and then retrieve the values from `w.grad` and `b.grad`:

```
loss.backward()  
print(w.grad)  
print(b.grad)
```

Out:

```
tensor([[0.0286, 0.1466, 0.2703],  
        [0.0286, 0.1466, 0.2703],  
        [0.0286, 0.1466, 0.2703],  
        [0.0286, 0.1466, 0.2703],  
        [0.0286, 0.1466, 0.2703]])  
tensor([0.0286, 0.1466, 0.2703])
```

6.3 Disabling Gradient Tracking

By default, all tensors with `requires_grad=True` are tracking their computational history and support gradient computation. However, there are some cases when we do not need to do that, for example, when we have trained the model and just want to apply it to some input data, i.e. we only want to do *forward* computations through the network. We can stop tracking computations by surrounding our computation code with `torch.no_grad()` block:

```
z = torch.matmul(x, w)+b
print(z.requires_grad)

with torch.no_grad():
    z = torch.matmul(x, w)+b
print(z.requires_grad)
```

Out:

True
False

6.3 Disabling Gradient Tracking (Cont'd)

Another way to achieve the same result is to use the `detach()` method on the tensor:

```
z = torch.matmul(x, w)+b
z_det = z.detach()
print(z_det.requires_grad)
```

Out:

```
False
```

Optimization

7.1 Loss Function

Common loss functions include `nn.MSELoss` (Mean Square Error) for regression tasks, and `nn.NLLLoss` (Negative Log Likelihood) for classification. `nn.CrossEntropyLoss` combines `nn.LogSoftmax` and `nn.NLLLoss`.

We pass our model's output logits to `nn.CrossEntropyLoss`, which will normalize the logits and compute the prediction error.

```
# Initialize the loss function
loss_fn = nn.CrossEntropyLoss()
```

7.2 Optimizer

We initialize the optimizer by registering the model's parameters that need to be trained, and passing in the learning rate hyperparameter.

```
optimizer = torch.optim.SGD(model.parameters(), lr=learning_rate)
```

Inside the training loop, optimization happens in three steps:

- Call `optimizer.zero_grad()` to reset the gradients of model parameters. Gradients by default add up; to prevent double-counting, we explicitly zero them at each iteration.
- Backpropagate the prediction loss with a call to `loss.backward()`. PyTorch deposits the gradients of the loss w.r.t. each parameter.
- Once we have our gradients, we call `optimizer.step()` to adjust the parameters by the gradients collected in the backward pass.

7.3 Full Implementation – Train Loop

```
def train_loop(dataloader, model, loss_fn, optimizer):
    size = len(dataloader.dataset)
    for batch, (X, y) in enumerate(dataloader):
        # Compute prediction and loss
        pred = model(X)
        loss = loss_fn(pred, y)

        # Backpropagation
        optimizer.zero_grad()
        loss.backward()
        optimizer.step()

        if batch % 100 == 0:
            loss, current = loss.item(), batch * len(X)
            print(f"loss: {loss:.3f} [{current}/{size}]")
```

7.4 Full Implementation – Test Loop

```
def test_loop(dataloader, model, loss_fn):
    size = len(dataloader.dataset)
    num_batches = len(dataloader)
    test_loss, correct = 0, 0

    with torch.no_grad():
        for X, y in dataloader:
            pred = model(X)
            test_loss += loss_fn(pred, y).item()
            correct += (pred.argmax(1) == y).type(torch.float).sum().item()

    test_loss /= num_batches
    correct /= size
    print(f"Test Error: \n Accuracy: {(100*correct):>0.1f}%, Avg loss: {test_loss:>8f} \n")
```

7.5 Full Implementation

```
loss_fn = nn.CrossEntropyLoss()
optimizer = torch.optim.SGD(model.parameters(), lr=learning_rate)

epochs = 10
for t in range(epochs):
    print(f"Epoch {t+1}\n-----")
    train_loop(train_dataloader, model, loss_fn, optimizer)
    test_loop(test_dataloader, model, loss_fn)
print("Done!")
```

7.5 Full Implementation (Cont'd)

Out:

Epoch 1

```
-----  
loss: 2.296602 [ 0/60000]  
loss: 2.292679 [ 6400/60000]  
loss: 2.274081 [12800/60000]  
loss: 2.275222 [19200/60000]  
loss: 2.255478 [25600/60000]  
loss: 2.224747 [32000/60000]  
loss: 2.242173 [38400/60000]  
loss: 2.200988 [44800/60000]  
loss: 2.185223 [51200/60000]  
loss: 2.183314 [57600/60000]
```

Test Error:

Accuracy: 41.7%, Avg loss: 2.162542

Epoch 2

```
-----  
loss: 2.160909 [ 0/60000]  
loss: 2.156497 [ 6400/60000]
```

Save & Load Model

8.1 Saving and Loading Model Weights

PyTorch models store the learned parameters in an internal state dictionary, called `state_dict`. These can be persisted via the `torch.save` method:

```
model = models.vgg16(pretrained=True)
torch.save(model.state_dict(), 'model_weights.pth')
```

To load model weights, you need to create an instance of the same model first, and then load the parameters using `load_state_dict()` method.

```
model = models.vgg16() # we do not specify pretrained=True, i.e. do not load default weights
model.load_state_dict(torch.load('model_weights.pth'))
model.eval()
```

8.2 Saving and Loading Models with Shapes

When loading model weights, we needed to instantiate the model class first, because the class defines the structure of a network. We might want to save the structure of this class together with the model, in which case we can pass `model` (and not `model.state_dict()`) to the saving function:

```
torch.save(model, 'model.pth')
```

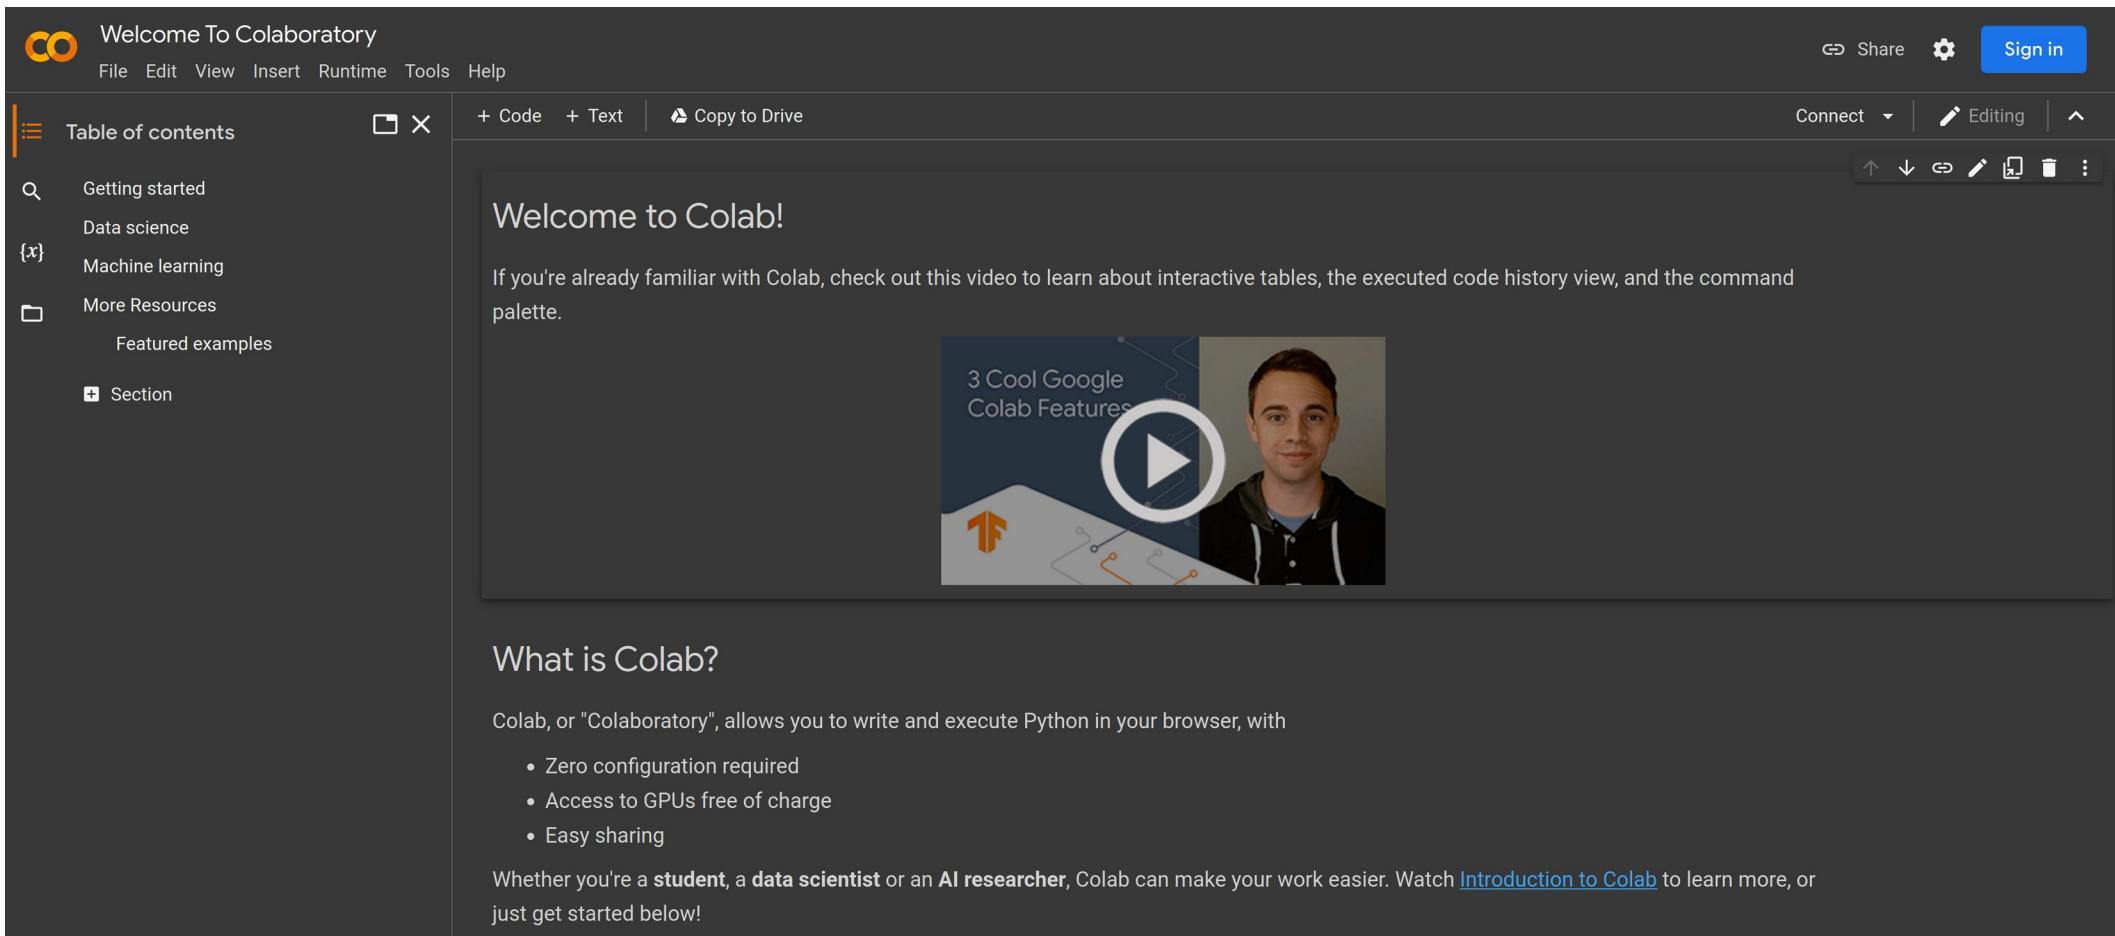

We can then load the model like this:

```
model = torch.load('model.pth')
```

Google Colab

9.1 Free Online GPUs: Google Colab

The screenshot shows the Google Colab interface. At the top, there's a navigation bar with the 'Welcome To Colaboratory' logo, 'File', 'Edit', 'View', 'Insert', 'Runtime', 'Tools', and 'Help' menus, along with 'Share', 'Settings', and 'Sign in' buttons. Below the navigation bar is a toolbar with 'Table of contents', 'Code', 'Text', 'Copy to Drive', 'Connect', 'Editing' mode, and various file operations like upload, download, and delete. On the left, a sidebar titled 'Table of contents' lists sections: 'Getting started', 'Data science', 'Machine learning', 'More Resources' (which includes 'Featured examples' and '+ Section'), and a search bar. The main content area features a large heading 'Welcome to Colab!', a descriptive text about the Colab environment, and a video thumbnail titled '3 Cool Google Colab Features' featuring a man speaking. Below this, a section titled 'What is Colab?' provides a brief description and a bulleted list of benefits: 'Zero configuration required', 'Access to GPUs free of charge', and 'Easy sharing'. A note at the bottom encourages users to watch an introduction video or get started.

Welcome to Colab!

If you're already familiar with Colab, check out this video to learn about interactive tables, the executed code history view, and the command palette.

3 Cool Google Colab Features

What is Colab?

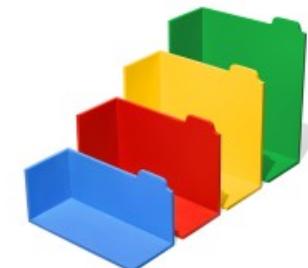

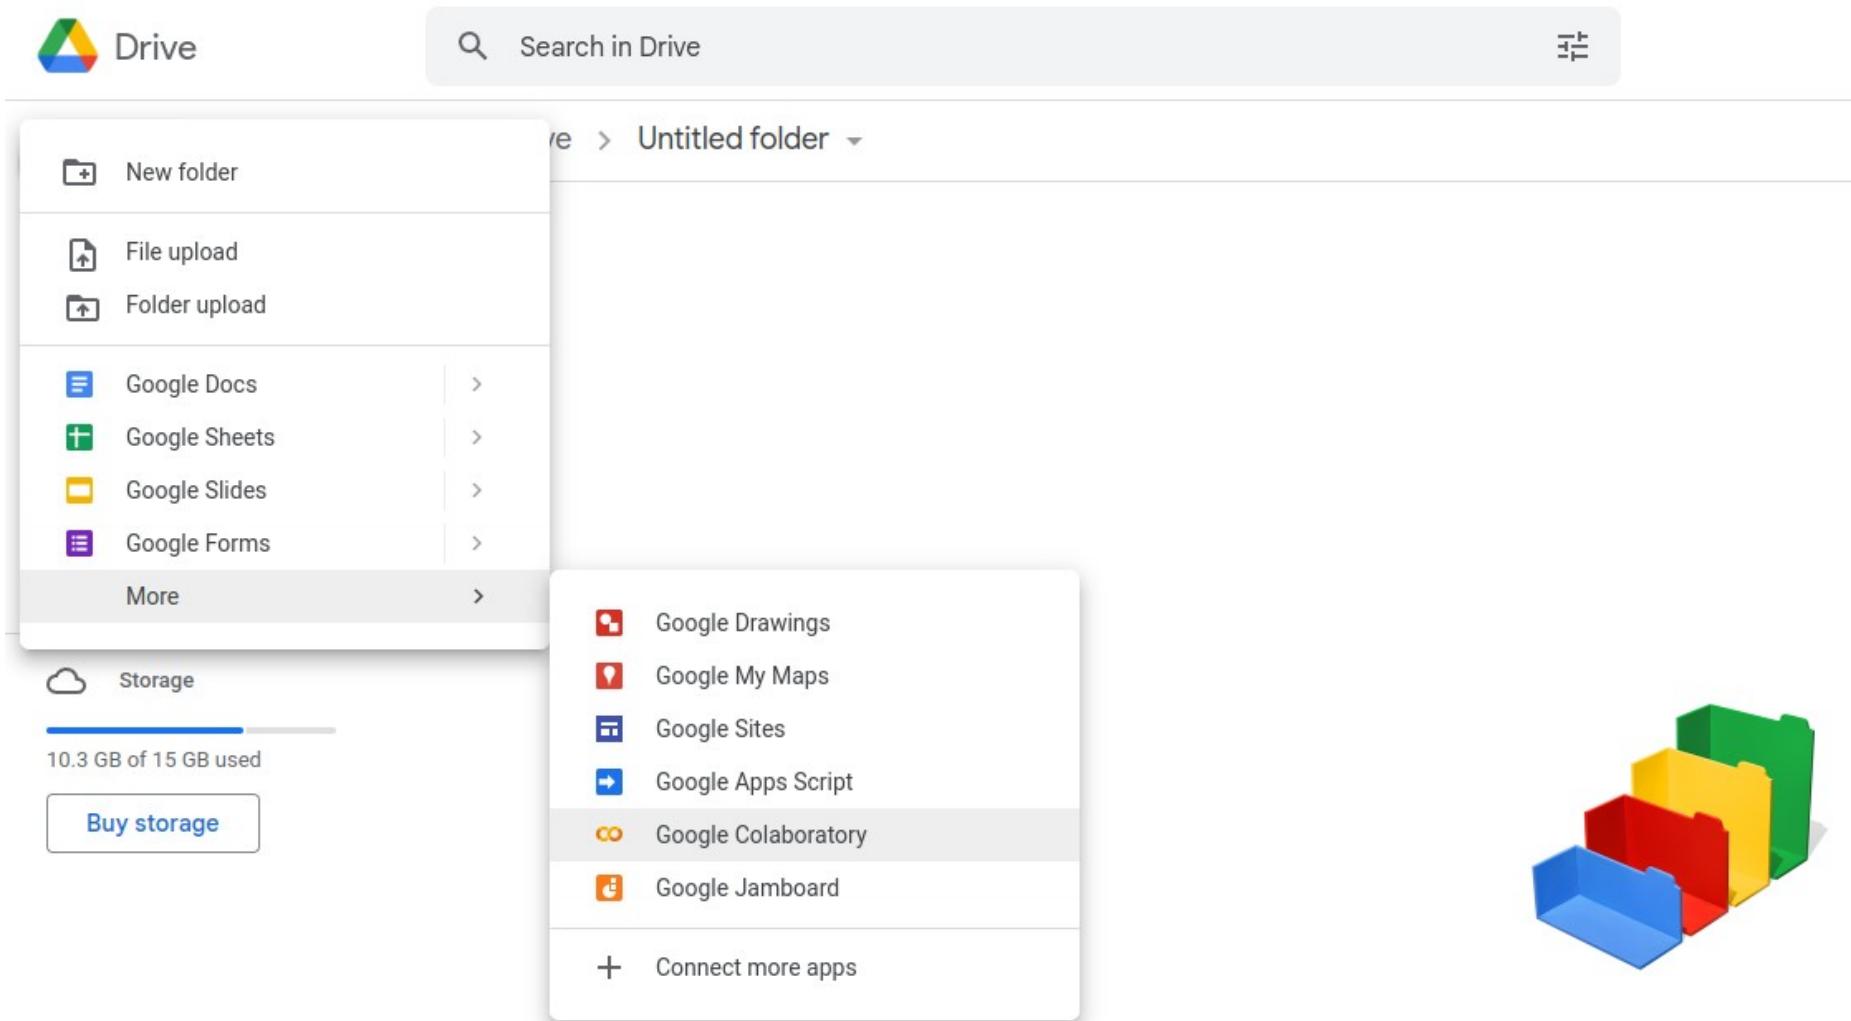

Colab, or "Colaboratory", allows you to write and execute Python in your browser, with

- Zero configuration required
- Access to GPUs free of charge
- Easy sharing

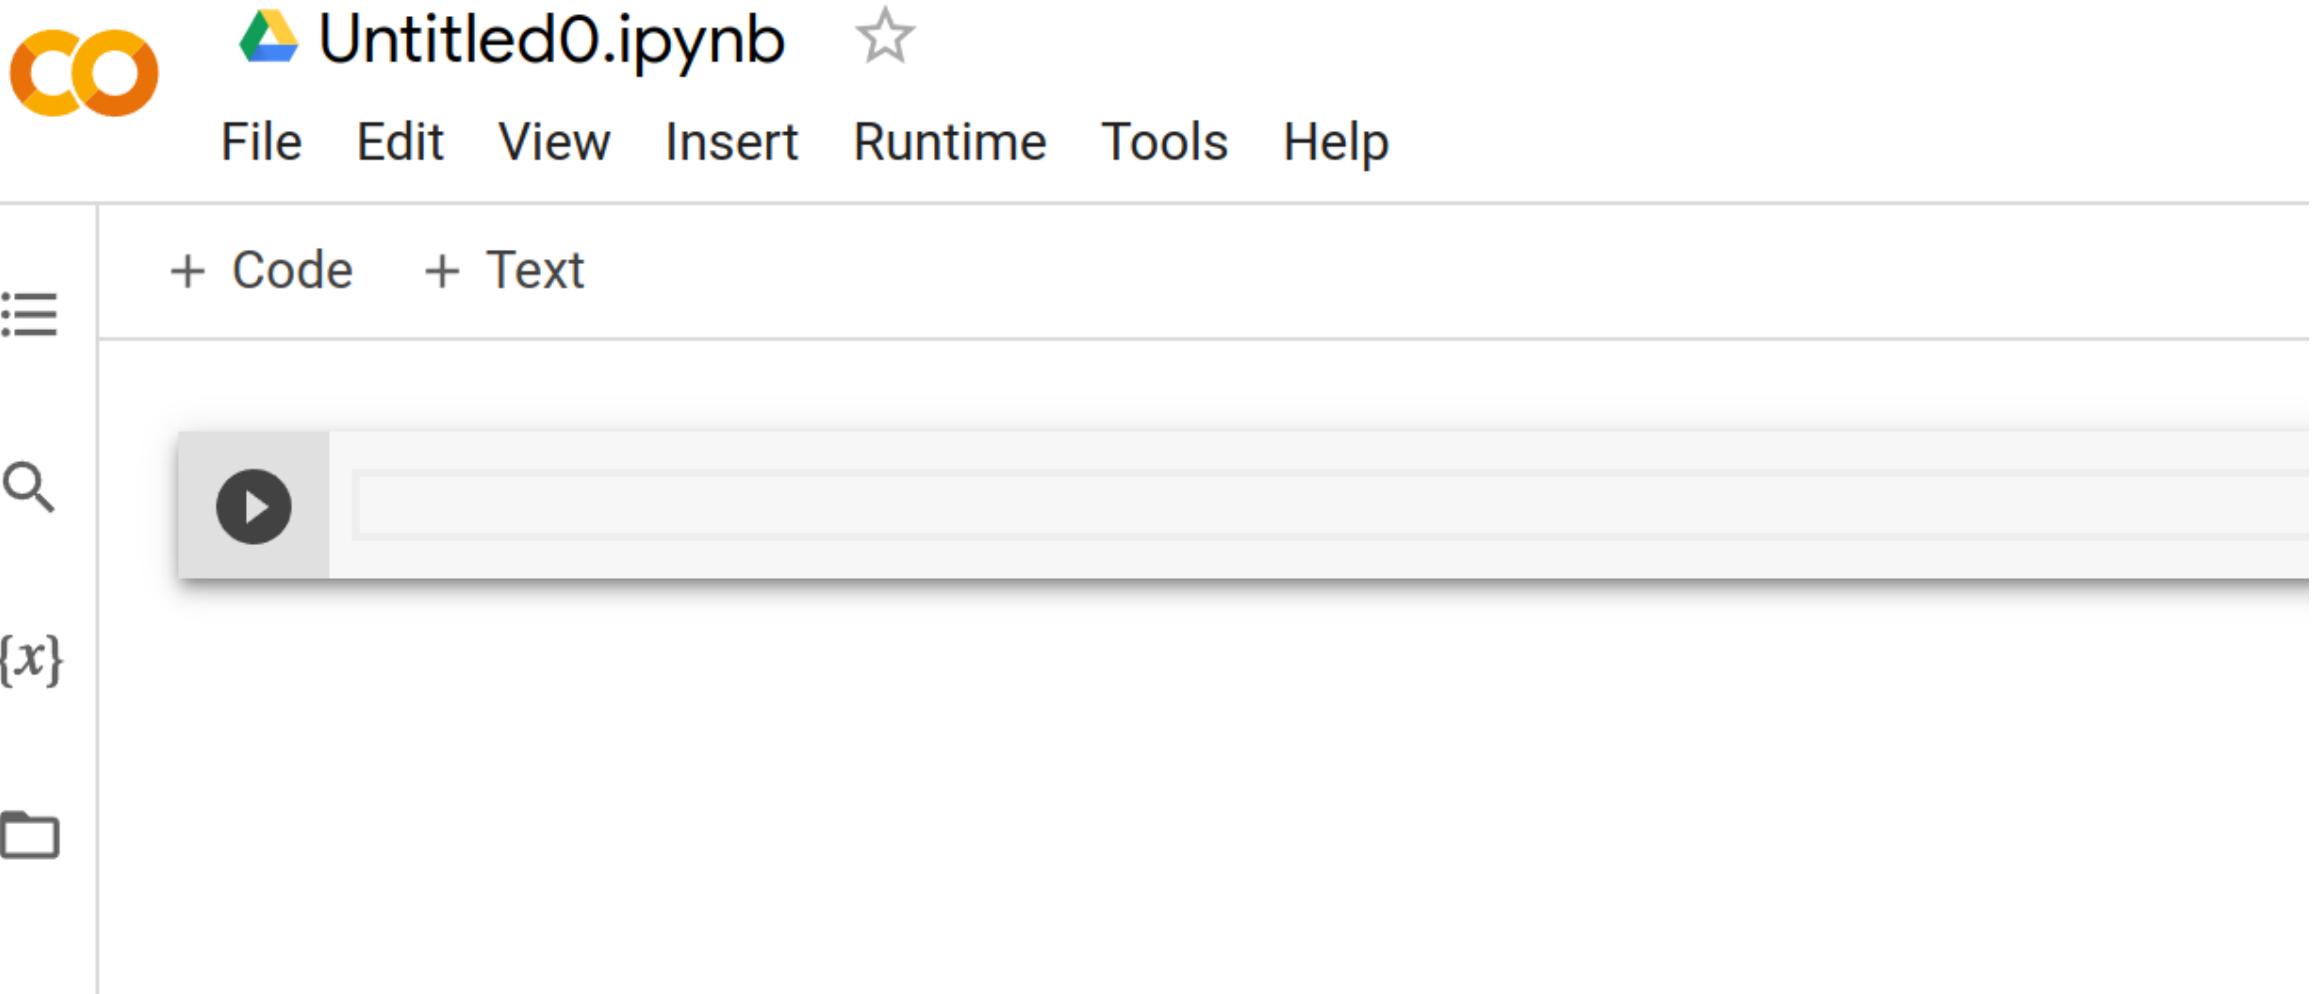

Whether you're a **student**, a **data scientist** or an **AI researcher**, Colab can make your work easier. Watch [Introduction to Colab](#) to learn more, or just get started below!

9.4 Run experiments on Colab

The screenshot shows a Google Colab interface with the following details:

- Title:** quickstart_tutorial.ipynb
- File Menu:** File, Edit, View, Insert, Runtime, Tools, Help, Cannot save changes
- Files Sidebar:** Shows a directory structure:
 - ..
 - data
 - FashionMNIST
 - raw
 - t10k-images-idx3-ubyte
 - t10k-images-idx3-ubyte.gz
 - t10k-labels-idx1-ubyte
 - t10k-labels-idx1-ubyte.gz
 - train-images-idx3-ubyte
 - train-images-idx3-ubyte.gz
 - train-labels-idx1-ubyte
 - train-labels-idx1-ubyte.gz
 - sample_data
 - README.md
 - anscombe.json
 - california_housing_test.csv
 - california_housing_train.csv
 - Code Editor:** Displays code cells and their execution results.
 - Cell 1: `%matplotlib inline` (status: 0s, result: green checkmark)
 - Cell 2: `[2] import torch
from torch import nn
from torch.utils.data import DataLoader
from torchvision import datasets
from torchvision.transforms import ToTensor` (status: 3s, result: green checkmark)
 - Navigation Bar:** Learn the Basics, Quickstart, Tensors, Datasets & DataLoaders, Transforms, Build Model, Autograd, Optimization, Save & Load Model
 - Section Headers:** Quickstart, Working with data
 - Description:** This section runs through the API for common tasks in machine learning. Refer to the links in each section to dive deeper.
 - Text Content:** PyTorch has two primitives to work with data: `torch.utils.data.DataLoader` and `torch.utils.data.Dataset`. `Dataset` stores the samples and their corresponding labels, and `DataLoader` wraps an iterable around the `Dataset`.

9.5 Another online Free GPUs: Gradient

Training and Validation Datasets

```
def bert_cased_tokenizer(strings):
    ...
    converts cudf.Series of strings to two torch tensors- token ids and attention mask with padding
    num_strings = len(strings)
    num_bytes = strings.str.byte_count().sum()
    token_ids, mask = strings.str.subword_tokenize("resources/bert-base-cased-hash.txt", 256, 256,
                                                    max_rows_tensor=num_strings,
                                                    do_lower=False, do_truncate=True)[:2]
    # convert from cupy to torch tensor using dlpack
    input_ids = from_dlpack(token_ids.reshape(num_strings, 256).astype(cupy.float).toDlpack())
    attention_mask = from_dlpack(mask.reshape(num_strings, 256).astype(cupy.float).toDlpack())
    return input_ids.type(torch.long), attention_mask.type(torch.long)
```

```
input_ids, attention_masks = bert_cased_tokenizer(logs_df.raw_preprocess)
```

```
# create dataset
dataset = TensorDataset(input_ids, attention_masks, logs_df['label'])
```

```
# use pytorch random_split to create training and validation data subsets
dataset_size = len(input_ids)
training_dataset, validation_dataset = random_split(dataset, (int(dataset_size*.8), int(dataset_size*.2)))
```

9.6 Install PyTorch at local machine

PyTorch Build	Stable (1.13.1)		Preview (Nightly)	
Your OS	Linux	Mac		Windows
Package	Conda	Pip	LibTorch	Source
Language	Python		C++ / Java	
Compute Platform	CUDA 11.6	CUDA 11.7	ROCM 5.2	CPU
Run this Command:	<pre>conda install pytorch torchvision torchaudio pytorch-cuda=11.6 -c pytorch -c nvidia</pre>			

Source: <https://pytorch.org/>

9.7 Install previous versions of PyTorch

COMMANDS FOR VERSIONS < 1.0.0

Via conda

This should be used for most previous macOS version installs.

To install a previous version of PyTorch via Anaconda or Miniconda, replace “0.4.1” in the following commands with the desired version (i.e., “0.2.0”).

Installing with CUDA 9

```
conda install pytorch=0.4.1 cuda90 -c pytorch
```

or

```
conda install pytorch=0.4.1 cuda92 -c pytorch
```
